

Postscript settings for PageMaker 6.5 & 7 (Mac & PC)

PageMaker has the ability to create Postscript directly from within the application.

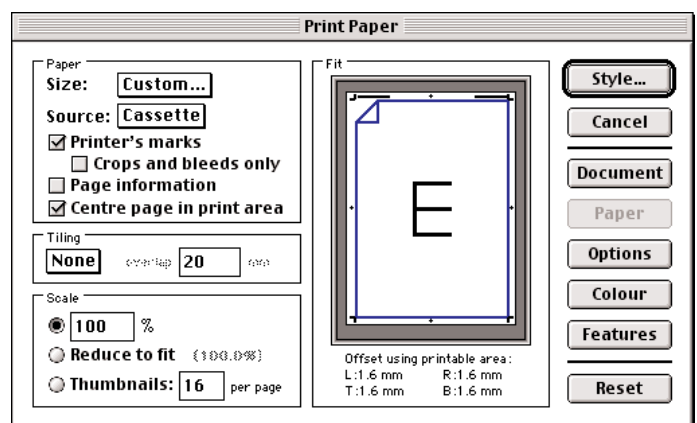

Therefore it does not matter what default printer you have selected.

The PPD shown here is **Prinerigy_Refiner**, but it can be replaced with the **Acrobat Distiller** PPD.

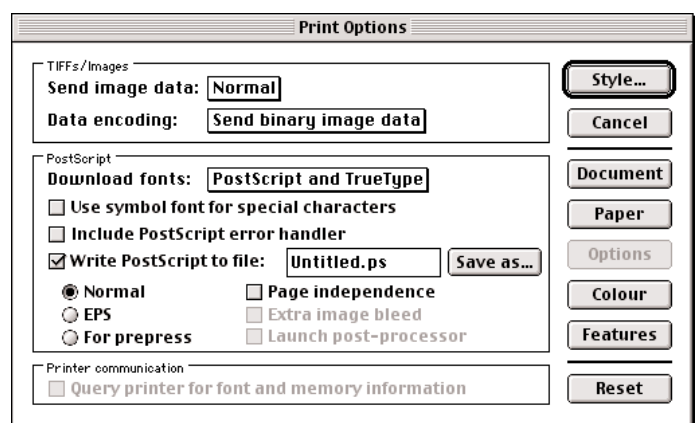

Choose **Custom** from the **Size** pop-up menu and enter a size 30mm wider and 30mm deeper than the document size.

If Custom is not available, select a paper size that is larger than your document size to accommodate automatic crop marks and bleed.

When selecting **Write Postscript to file**, click on the **Save as . . .** button and select an appropriate location to save the postscript file.

Settings as shown.

It is not necessary to alter the **Optimised screen**, **Frequency** and **Angle** settings.

These settings are overridden at final output.
